SITE VISIT FROM RSP ARCHITECTS & GRADUATE STUDENTS

We recently hosted a site visit from RSP Architects, who were accompanied by two graduate students—one pursuing a career in architecture and the other undertaking an apprenticeship—as well as an additional RSP architect currently working on another live Indurent project. The visit provided a valuable opportunity to share practical knowledge and showcase the progress of the works to date.

The group was taken on a tour, which outlined works that have been completed like the attenuation system and providing them and overview of ongoing activities such as steel frame install, cladding works and groundworks.

As part of the visit they also walked along the first floor, where the trapezoidal composite floor deck has been installed, and observed works progressing on the installation of steel reinforcement bars ahead of the concrete pour. They also accessed the roof where they were able to walk the area and gain a general view of the roof cladding installation.

Visiting the site in person makes a big difference—what was once just drawings and plans becomes real, helping you clearly see how the whole project is coming together.
